

Questions About Data

17/5/2026

1- What is the best approach for a company when dealing with fraud detection?

Explanation :

Should the main objective be maximizing the number of detected fraud cases, even if some legitimate customers are mistakenly flagged or should the focus be on achieving higher precision versus higher recall?

For example, one possible solution is identifying merchants and customers with highly suspicious transaction patterns, deactivating those merchants, and continuously tracking related customers. However, this approach may negatively impact legitimate users who are not actually fraudulent, which could eventually cause customers to lose trust in the company due to false accusations or unnecessary restrictions.

"TX_FRAUD_SCENARIO column can be used post-hoc to understand where your model succeeds and where it struggles"

2- Could you please clarify what is meant by “post-hoc” in this context?

3-Could you please explain what Card Precision@k represents and how it differs from the standard Precision@k metric?

4- Could you please clarify what X_Customer_ID and Y_Customer_ID represent in the dataset and what each one refers to?
